

Some users reported that the Status Bar countdown timer was not displaying any longer for them in SSEM. The problem is a security setting in Internet Explorer. Based on the following knowledge base article, to enable the countdown timer for SSEM, <http://msdn2.microsoft.com/en-us/ie/aa740486.aspx> , simply perform the following steps on the end user's pc.

Status Bar Scripting--Scripts will no longer be able to set the status bar text through the window.status and window.defaultStatus methods by default in the Internet and Restricted Zones. This helps prevent attackers from leveraging those methods to spoof the status bar. To revert to previous behavior and allow scripts to set the status bar through window.status and window.defaultStatus, follow these steps:

Open Internet Explorer, click the **Tools** button, click **Internet Options**, and then click the **Security** tab.

Click **Internet or Restricted sites**, and then click the **Custom level** button.

Scroll down to **Allow status bar updates via script**, select **Enable**.

Click **OK** until you return to Internet Explorer.
